

1. Use the equation  $x = \sqrt{4y}$  to find the y-value of a point on the parabola when:
  - a. the x-value is 5
  
  
  
  
  
  
  
  
  
  
  - b. the x-value 10
  
  
  
  
  
  
  
  
  
  
  - c. the x-value is 437
  
2. What similarities do you notice across your methods for finding the y-values in Tasks 1a, 1b, and 1c?
  
  
  
  
  
  
  
  
  
  
3. Are your methods for finding the y-values the same as Keoni and Sasha's? If they are different, why do both methods work?
